Passion
for LPG

Seeing is believing

Designed to be seen

See-through, easy to handle and with an eye-catching design, Passion is the definitive choice in gas cylinders for modern household consumers.

Easy to handle

Household users want effortless handling. Made of fibreglass reinforced vinylester, Passion is considerably lighter than a conventional gas cylinder. Easy to transport, easy to handle and easy to refill.

Seeing is believing

Passion is the most transparent gas cylinder on the market. The see-through surface allows the user to control the gas level inside at any time, knowing exactly when a refill is needed and never having to worry about running out of gas at the next barbecue.

and function
intersect

Design for domestic use

Safe and durable

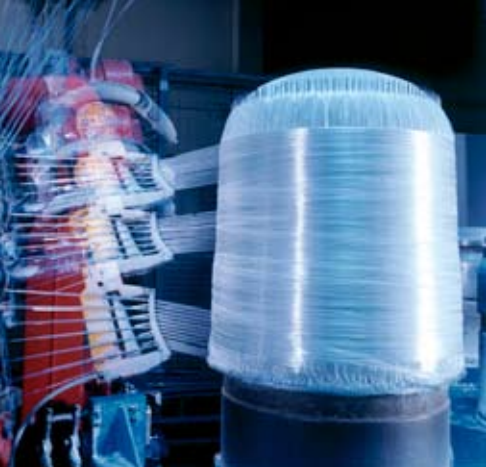

In gas cylinder design, safety is a fundamental aspect. Passion is developed according to advanced stress calculations, making it resilient and very impact resistant. It is also corrosion-free and will last for refill after refill. A safer and more intelligent choice in the long run.

Eye-catching design

Modern consumers want modern design. With its colourful exterior, Passion is definitely designed to be seen. In combination with its ergonomic properties such as low weight and easy-to-grip handles, this makes Passion the definitive choice for household users.

Environmentally safe

Today, the environmental issue is more important than ever. In-depth studies have shown that composite cylinders have less impact on the environment, compared to traditional gas cylinders. This is mainly due to the low transport weight of the composite cylinder and its long working life.

Manufacturing

Composite Scandinavia has manufactured gas cylinders in serial production since 1995. The process requires no liner. Instead, two halves are wound with fibreglass, then injected with resin under high pressure in a hermetic process. After hardening, the two halves are demoulded and then joined using a specially developed method. Following inspection and pressure testing the casing and valves are assembled. Naturally, the cylinders are approved by an accredited inspection body and comply with the new European norms.

The company

Composite Scandinavia is a developer and manufacturer of transparent, safe and light-weight composite gas cylinders for the industry and consumer markets. For more than twenty years, we have been at the cutting edge of gas cylinder development. Today we offer a wide range of composite gas cylinders for industrial and household use, manufactured through a highly automated process.

Passion™

Passion 8

- Worldclass transparency
- Designed to be seen
- Easy to handle
- Safe and durable
- Eco-friendly
